

mSPQoS 3.5.0.30 for BCM 3.5

Problem Description

1. Packet sizes larger than 1420 bytes could not be sent over a connection between ADSL and WAN. This was caused by a problem with sending out-of-order IP fragments. These fragments were being dropped. This is not specific to IPsec.
2. During file transfer through the Firewall, eventually the transfer would stop. This was caused by the TCP window value being adjusted and then the amount of data in the packet would go over the new window size.
3. A blue screen occurred in the function PTDelH245().
4. A blue screen occurred when allocating packets.
